Table of Contents

1 Overview valve bank (directional seated valve) type VB

The valve bank type VB combines valves in accordance with D 7300 and D 7300-12 to control independent consumers.

The valve bank comprises multiple directional seated valves of the types G, WG etc., which are connected in parallel. The directional seated valves are ball valves, and have zero leakage when closed. They are flange-mounted on sub-plates. These sub-plates are clamped between the connection block (P and R port) and the end plate via tension rods. Pressure switches and pressure-limiting valves can be integrated into the pump lines and/or load lines.

2/2, 3/2, 4/2, 3/3 and 4/3-way seated valves with different types of actuation are available. The valve bank can be mounted directly on compact hydraulic power packs using connection blocks.

Valve bank (directional seated valve) type VB

Features and advantages

- Compact hydraulic control systems for operating pressures of up to 700 bar
- Can be combined with compact hydraulic power packs for low-cost complete solutions
- Elimination of time-consuming installation due to combination with hydraulic power packs
- Modular system design makes repairs easy

Intended applications

- Machine tools (chipping and non-chipping)
- Clamping, punching and jigs
- Rubber and plastics machinery

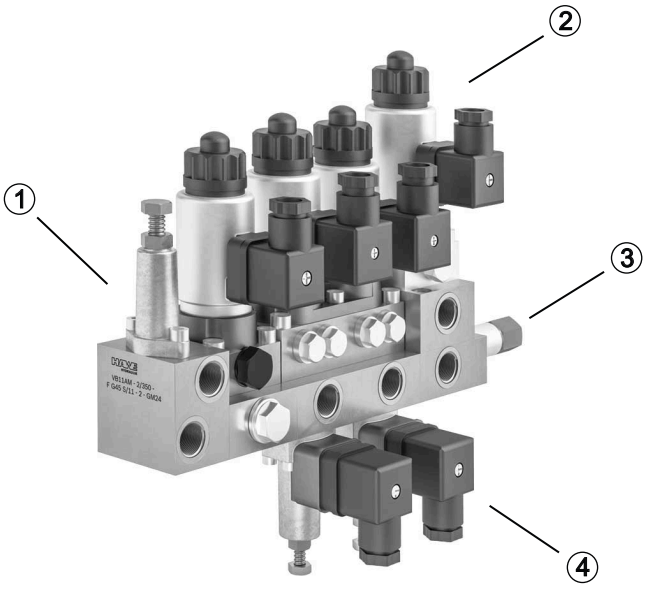
1.1 Ordering examples

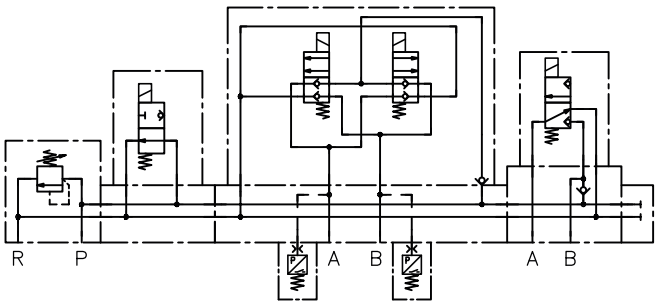
Example 1

VB 11 AM - 2/350 - F G45 S/11 - 2 - GM 24

For allocation of coding and main data, see Chapter 2.1, "ordering example"

Directional valve bank for pipe connection (identical actuation for all directional valves)





P = Pressure connection (pump)
R = Reflux port (to tank)
A, B = Consumer ports

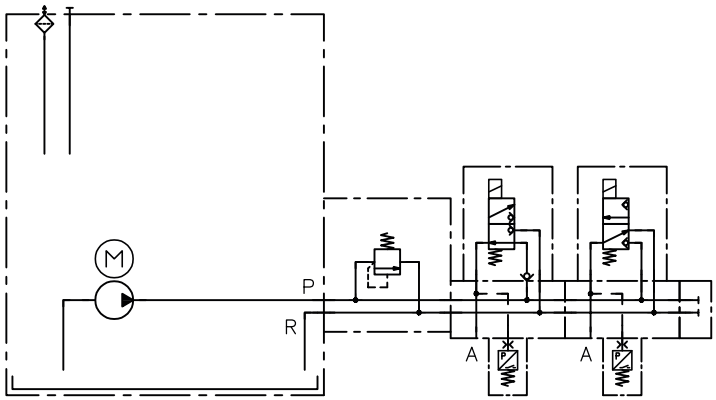
1 Connection block
2 Directional valves
3 End plate with extension
4 Pressure switch

Example 2

KA 24 S/H 1,51 - A2/420	- VB 11 FM - R5H5 - 1 - GM 24
	Directional valve bank for mounting on a compact hydraulic power pack

Pump order coding, e.g. KA 24 S/H 1.51 – A2/420 (in accordance with D 8010)

For allocation of directional valve bank coding and main data, see Chapter 2.1, "ordering example"



P = Pressure connection (pump)
R = Return port
M = Pressure connection, e.g. for pressure gauge or measurement fitting
A = Consumer port

The coding can be added to the ends of the end plate versions listed above, e.g. ▪ VB01FM-FHH/11 ▪ VB01FM-FHH/365 12 ▪ VB01FM-FHH/62 11		●	●
/12 /...12			●	●

3 Parameters

3.1 General information

Designation	Valve bank
Design	Section structure; max. 12 valves (VB 01 and VB 11) or 10 valves VB 21, VB 31 combinable, circuit symbols G and J counted as 2 valves
Model	Manifold mounting valve
Material	Steel;Electro-galvanised valve housing;Hardened and ground functional inner parts Coil housing, zinc/nickel, electrogalvanised
Attachment	see Chapter 4, "Dimensions"
Overlap	Negative, transition from one flow direction to the other is completed only at the stroke end position. During switching, all passages are connected to each other.
Installation position	Any; vertical with actuating part upwards preferred
Ports/connections	▪ **P..** = Pump port ▪ **R..** = Return port ▪ **A, B** = Consumer ports ▪ **M..** = Pressure gauge connection
Flow direction	only in direction of arrow according to circuit symbol, see Chapter 2.4, "Valve sections". The connections P (pump connection), R (reflux), A and B (consumers) are determined by the internal action of the valve and cannot be changed.
Hydraulic fluid	Hydraulic fluid, according to DIN 51 524 Parts 1 to 3; ISO VG 10 to 68 according to DIN ISO 3448 Viscosity range: 4 - 800 mm²/s Optimal operating range: approx. 10 - 200 mm²/s Also suitable for biologically degradable hydraulic fluids type HEPG (polyalkylene glycol) and HEES (synthetic ester) at operating temperatures up to approx. +70°C.
Cleanliness level	**ISO 4406** 21/18/15...19/17/13
Temperatures	Environment: approx. -40 to +80 °C, hydraulic fluid: -25 to +80 °C, pay attention to the viscosity range. Start temperature: down to -40 °C is permissible (take account of the start viscosities!), as long as the steady-state temperature is at least 20 K higher during subsequent operation. Biologically degradable hydraulic fluids: note manufacturer specifications. With consideration for the seal compatibility, not above +70°C.

INFORMATION

Observe the restrictions for explosion-proof solenoids.

Observe the correct duty cycle, see Chapter 3.3, "Electrical data"!

3.3 Electrical data

INFORMATION

- Observe the correct duty cycle, see D 7300, D 7300-12!
- Observe the restrictions for explosion-proof solenoids.
- Outdoor use, comparative protection class for mechanical part IP 40 (EN 60529)

For further technical data, see D 7300, D 7300-12

Circuit diagrams

DC voltage	**G (M).., X (M)..** 	**L (M)..** AC voltage	**WG (M) 110, WG (M) 230** 	

X 24 EX 55 FM ON REQUEST:
Electrical data for explosion-proof solenoids

NOTICE

When using solenoids for potentially explosive atmospheres, it is essential to observe the operating instructions B ATEX and the separate operating instructions for the respective solenoid.

Refer to the applicable operating instructions B 40/2017 for operating thresholds, classifications, electrical parameters and electrical connections.

Relative duty cycle

The duty cycle ED [%] depends on the ambient temperature and the cable type being used.

Cable type	Ambient temperature	
	40 °C	55 °C
Single valve		
90 °C	Duty cycle 75%	Duty cycle 50%
105 °C	Duty cycle 100%	Duty cycle 75%
125 °C	Duty cycle 100%	Duty cycle 100%
Linking, adjacent valves		
90 °C	Duty cycle 50%	Duty cycle 25%
105 °C	Duty cycle 75%	Duty cycle 50%
125 °C	Duty cycle 100%	Duty cycle 100%

For the definition of the duty cycle [%]: see B ATEX, Chapter 2.3 “Safety instructions”
Cable kits available separately, see B ATEX

Dimensioning Sub-plates

Single valve
Block volume 65 250 mm³, block dimensions 29 mm x 45 mm x 50 mm
Linking, single valves arranged next to one another
Block volume 57 500 mm³, block dimensions 25 mm x 46 mm x 50 mm
Linking width 46 mm

CAUTION

- Take particular care during assembly and dismantling work!
- The surfaces must not be damaged under any circumstances!

INFORMATION

Dimensions apply to all end plates.

5 Installation, operation and maintenance information

Observe the document B 5488 “General operating instructions for assembly, commissioning, and maintenance.”

5.1 Intended use

This product is intended exclusively for hydraulic applications (fluid technology).

The user must observe the safety measures and warnings in this document.

Essential requirements for the product to function correctly and safely:

- ► All information in this documentation must be observed. This applies in particular to all safety measures and warnings.
- ► The product must only be assembled and put into operation by specialist personnel.
- ► The product must only be operated within the specified technical parameters described in detail in this document.
- ► All components must be suitable for the operating conditions when using an assembly.
- ► The operating instructions for the components, assemblies and the specific complete system must also always be observed.

If the product can no longer be operated safely:

1. Remove the product from operation and mark it accordingly.
   ✓ It is then not permitted to continue using or operating the product.

5.2 Assembly information

The product must only be installed in the complete system with standard and compliant connection components (screw fittings, hoses, pipes, fixtures etc.).

The product must be shut down correctly prior to disassembly (in particular in combination with hydraulic accumulators).

⚠ **DANGER**

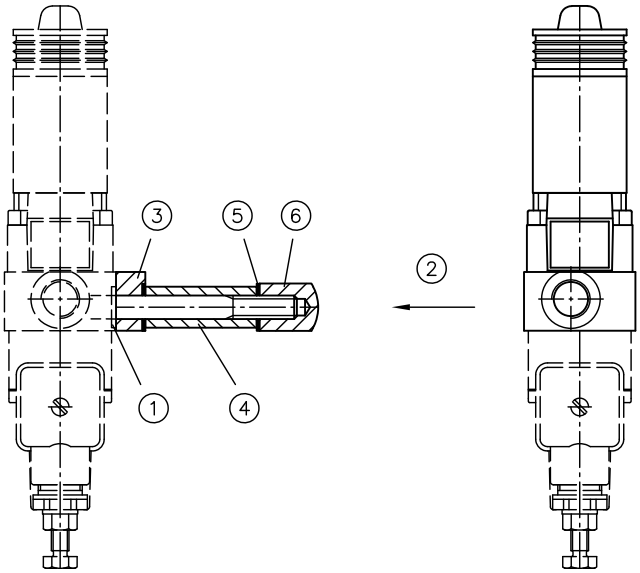
Sudden movement of the hydraulic drives when disassembled incorrectly

Risk of serious injury or death

- ► Depressurise the hydraulic system.
- ► Perform safety measures in preparation for maintenance.

5.2.1 Directional valve section – Installation

For retrofitting in directional valve banks, e.g. instead of the free space in the end plates, /.11; /.12 for VB 01 and VB 11 Chapter 2.6 and Chapter 4.5, otherwise, order for new number of valves when extending the tension rod. The terms “valve section ...” and “for valve bank VB..” must be entered in the clear text.



1 When threading the valve section onto the tension rod, take care not to lose the O rings for the flange sides!
2 **Example**
End plate coding /11(12) comprising:
3 End plate with USIT ring
4 Spacer pipe for USIT ring
5 USIT ring
6 Cap nut

Valve sections to be retrofitted

Installation procedure:

1 Unscrew the nut(s) and pull all the parts off the tension rod, including the end plate
2 Thread the valve section on
3 Push the end plate on and tighten the cap nut(s) to the torque specified in the table below. For coding /. 11

Size	Tightening torque for tension rod fixtures (Nm)
VB 01	25
VB 11	40
VB 21	85
VB 31	190

Type	End plate with USIT ring	Spacer pipe *) HAWE no.	USIT ring	Cap nut HAWE no.
VB 01	U 8.7x16x1	7250 041	U 8.7x16x1	7250 015
VB 11	U 10.7x18x1.5	7251 041	U 10.7x18x1.5	7251 026

INFORMATION
*) For end plate coding /.12, two spacer pipes with a USIT ring between them, depending on size (only for VB 01 and VB 11).

5.3 Operating instructions

Observe product configuration and pressure/flow rate.

The statements and technical parameters in this document must be strictly observed.
The instructions for the complete technical system must also always be followed.

NOTICE

- ► Read the documentation carefully before usage.
- ► The documentation must be accessible to the operating and maintenance staff at all times.
- ► Keep documentation up to date after every addition or update.

CAUTION

Overloading components due to incorrect pressure settings.
Risk of minor injury.

- Pay attention to the maximum operating pressure of the pump, valves and fittings.
- Always monitor the pressure gauge when setting and changing the pressure.

Purity and filtering of the hydraulic fluid

Fine contamination can significantly impair the function of the product. Contamination can cause irreparable damage.

Examples of fine contamination include:

- Swarf
- Rubber particles from hoses and seals
- Dirt due to assembly and maintenance
- Mechanical debris
- Chemical ageing of the hydraulic fluid

NOTICE

New hydraulic fluid from the manufacturer may not have the required purity.
Damage to the product is possible.

- ► Filter new hydraulic fluid to a high quality when filling.
- ► Do not mix hydraulic fluids. Always use hydraulic fluid that is from the same manufacturer, of the same type, and with the same viscosity properties.

For smooth operation, pay attention to the cleanliness level of the hydraulic fluid (cleanliness level see Chapter 3, "Parameters").

Additionally applicable document: D 5488/1 Oil recommendations

5.4 Maintenance information

Check regularly (at least once a year) by visual inspection whether the hydraulic connections are damaged. If external leakages are found, shut down and repair the system.

Clean the surface of the device regularly (at least once a year) (dust deposits and dirt).

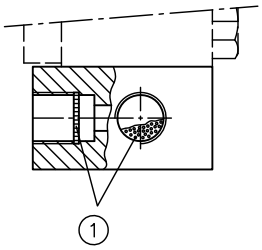
6 Other information

6.1 Accessories, spare and individual parts

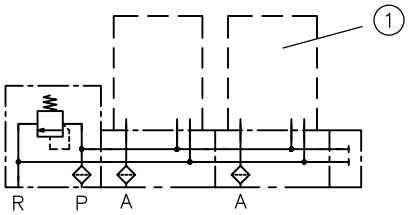
To purchase spare parts, please see HAWE Hydraulik interactive contact map.

6.1.1 Screen-filters installed as standard – D 7235

Directional seated valves are largely insensitive to the microfine, suspended contamination that is always present in hydraulic oil. However, occasional coarse contamination entrained by the flow of oil, such as torn particles of cuffs, scaling, swarf, etc., can lead to abrupt disturbances if it gets stuck in the valve gap and prevents the valve from closing. Therefore, the valves are already largely protected at the factory by built-in screen filters (D 7300, Item 4.2 and D 7300-12. Item 6.1.1). For additional preventative protection, filter screens or screen filters are inserted in the line connections of the directional valve banks VB 01... and VB 11... The screen filters and filter elements are no substitute for conventional hydraulic filters. However, as practice shows, they are sufficient to protect small hydraulic systems against malfunctions. If such malfunctions occur, the first step should be to check the screen filters. For the sake of simplicity, the screen filters are not shown separately in the circuit symbols.



1 Screen filters and filter elements



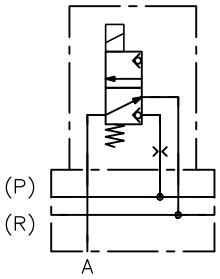
1 For detailed circuit symbols for directional valves see Chapter 2.4.1, "Valve sections without pressure switch"

Screen filters Coding	Ports	
	A, B	P
VB 01 A VB 01 F	HFC 1/4 F	HFC 1/4 F
VB 11 A...	HFC 1/4 or HFC 3/8	HFC 1/4 or HFC 3/8
VB 11 F...	HFC 1/4 or HFC 3/8	HFC 1/4 F up to 2.1 lpm, without for more
VB 01 C	HFC 1/4 F	Screen 5017 010 in the transition plate
VB 11 C	HFC 3/8	

INFORMATION
For VB 01 A, F, C, use screen filters HFC 1/4 F with the flatter filter canisters 6406 017 due to the limited depth of the threaded holes for ports A and B, see also D 7235. Please observe this notice when ordering parts for retrofitting (replacement).

6.1.2 Orifice insert D 6465

Circuit symbol

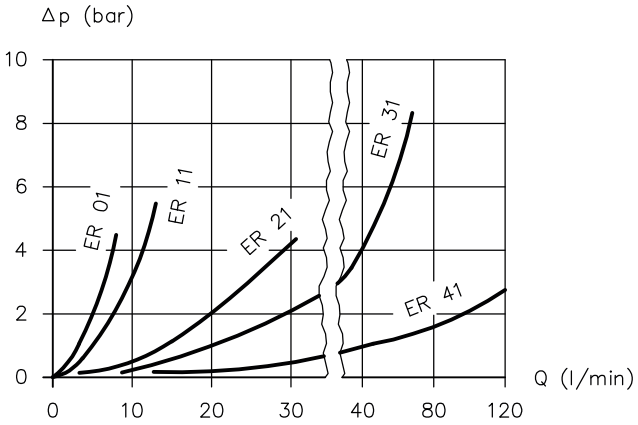


Ordering example

VB 11 AM - 5 - FHHN - 2 - GM 24

Valve H in Positions 2 and 3 with orifice insert EB 1 - 0.8

If orifice inserts in accordance with D 6465 are required at the inlets of valves B, C, O, P, H, L, Y, I, S, T and J for functional reasons (see Table 3 in D 7300 and Chap. 2.2 in D 7300-12), the clear text must be used to specify which valve (coding, position number counting from connection block) needs to be fitted with which orifice (type in accordance with D 6465) when ordering.



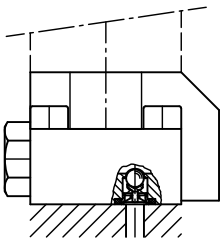
Q flow rate (lpm); Δp flow resistance (bar)

Viscosity of the hydraulic fluid approx. 60 mm²/s

Orifice insert Coding	VB 01	VB 11	VB 21	VB 31
B	EB 0 - 0.6	EB 01- 0.8	EB 2 - 1.2	EB 3 - 2.5

6.1.3 Return pressure stop

Check valves (coding K, M, U, V) can be installed in the reflux outlets R of the 3/2-way valves of sizes 0 and 1. They prevent pressure surges from the shared reflux line from affecting non-actuated, easily moved consumers with no load and thus causing uncontrolled advancing in systems where valves are connected in parallel and there is a connection between A → R. Such pressure surges can occur as a result of switching procedures.
The check valves are not suitable for blocking off the flow of hydraulic oil, which can occur as a result of switching combinations with other valves at R. The return pressure stop can be retrofitted.



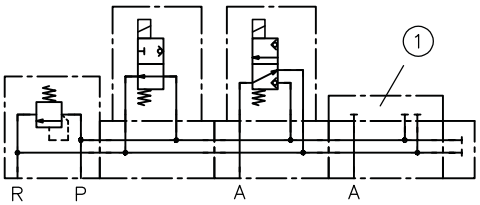
(matches additional element S in D 7300 Item 3.1, Table 3)

Return pressure stop Coding	VB 01	VB 11
S	7332 000a	7332 000 b

6.1.4 Reactive plate

Instead of a free space, see Chapter 2.6, "End plates and extensions", a sub-plate with a reactive cover that has already been installed can also be used in any position when retrofitting a directional seated valve. The clear text must be used to specify which valve (coding, position number counting from connection block) needs to be fitted this way.

Circuit symbol



1 Reactive plate (height 10 mm)

Ordering example

VB 11 AM - 1/380 - FHH - 1 - G 24

Valve H in Position 3 with reactive plate 5000 099 (or 6540 039 (see below))

Type	Reactive plate	3x O rings NBR 90 Sh	4x screws (ISO 4762)
VB 01	6540 039	3.7x1.78	M5x12-12.9 A2K
VB 11	5000 099	5x1.5	M6x20-12.9 A2K
VB 21	4900 099	10x2.2	M8x20-12.9 A2K
VB 31	5005 099	13.95x2.62	M10x40-12.9 A2K

6.2 Configuration and planning instructions

Basic type and size

The maximum pressure is determined based on the respective circuit symbol and the actuation type; see D 7300 Item 2 and 3.1 and D 7300-12 Table 1.

For pump delivery flows in the Q_{max} range, the flow resistances in D 7300 and D 7300-12 should be observed.
Please note: the valve sizes should be selected based not only on the pumps' delivery flow, but also on the largest flow rate resulting from the control procedure. Depending on the type of consumer in use (double-acting cylinder with uneven surface ratio), this may be larger than the pump delivery flow, e.g. in case of retraction or a differential circuit. In such cases, the valve size must be selected based on this flow rate.

Connection blocks and adapter plates

Steel spring dome only in case of pressure surges in the return line (> 20 bar), e.g. as a result of decompression surges when relieving the pressure from consumers with pressure storage capacity.
Adapter plates C, D do not have an additional pressure switch at directional valve.

Adapter plates C for hydraulic power packs with two pressure connections D 6010 DB, D 6010 S limited number of valves for P1, overlap for P2, better to use connection block A here.

Other adapter plates S and L for mounting valve banks VB 11 on air-driven hydraulic power packs type LP, see D 7280 H.

Actuation and actuating solenoid

The solenoid voltage and solenoid version are specified at the end of the valve bank and apply to all solenoids. The specifications regarding the IP protection class apply to the solenoid and properly assembled line connector.

Valve sections

The actuation symbols must be added to the directional valve circuit symbols.

A maximum of 12 valves can be combined for VB 01 and VB 11, or 10 for VB 21 and VB 31, G and J must be counted as 2 valves; A, D or F only once and, where possible, as first vale in the block bank/order coding.

Arrange the directional valves in the block in an order that ensures directly adjacent valves are not switched on for a long period of time (see Chapter 6.1, "Accessories, spare and individual parts").

A, B = outlet (consumer ports) P, R = internal supply and drain (pump and reflux)

Valve sections with pressure switches

PS in port A or B
Cannot be combined with directional seated valves coding D, A, F, P, O, I or Y, or block banks VB..C or VB..D.

PS in P gallery
For directional seated valves coding H, K, L, M, N, R, U and V. Eliminates the need for an end plate with PS. Cannot be combined with block banks VB..C or VB..D.

Intermediate plate with pressure switch

If it is not possible to mount a pressure switch on the end plate, e.g. due to a lack of space, the same result can be achieved by installing a single sub-plate with a flanged-on pressure switch in any position in the valve bank.

Intermediate plate with 2-way pressure reducing valve

Maximum permissible inlet pressure 500 bar (P side). The pressure reducing valves can be inserted in any position in the valve bank, and regulate/reduce the pressure for the downstream (secondary side) directional valves and the consumers connected on that side, even if pressure is simultaneously relieved via upstream (primary-side) directional valves in case of high pressure levels.
Examples: Clamping cylinders with low pressure settings or pilot valves for electro-hydraulic low pressure remote control.
The valves used are pressure reducing valves type CDK 3.. in accordance with D 7745. These valves are zero-leakage when closed (pump pressure higher than set secondary pressure). The check valve prevents unwanted oil reflux from the secondary to the primary (pump) side, end ensures that the pressure is always maintained reliably. In order to protect against impermissible excess pressure caused by increases in externally acting forces, the customer must install their own pressure-limiting valve in the load line if necessary. For information on the old version with the pressure reducing valve following the 3-way principle, see Item 2.7.2 Intermediate plates with 3-way pressure control valves.
2-way pressure reducing valve only available in fixed version. Setting can be adjusted after undoing a lock nut using a SW 17 spanner (monitor the pressure gauge!).
Secondary pressure setting (pressure gauge display) at flow rate Q = 0 lpm (consumer in end position). The pressure drops slightly when hydraulic oil flows to the consumer.
Version CZ X with tapped plug, prepared for retrofitting a CDK 3..
Version CZ 25.. with low pressure dependence for fluctuating pump (inlet) pressure and use with low pressure settings (caution: max. flow rate 6 lpm).
Version CZ 55.. with low flow resistance, but a higher pressure dependence for fluctuating pump (inlet) pressures.

Intermediate plate with 3-way pressure reducing valve

Due to the constant leakage oil consumption that occurs as a result of the function, even when there is no flow of hydraulic oil to the secondary side, leakages on the primary side can only be prevented (where necessary) by versions Z11 ... Z28 (Z114 ... Z2865) with an upstream 2/2-way seated valve. This valve should be activated in accordance with its circuit symbol whenever hydraulic oil is removed. The secondary side is protected against leakage oil by a check valve downstream of the pressure reducing valve; this ensures that there is no pressure loss when the secondary consumer is sealed and the pump is switched off.
However, it also means that the pressure reducing valve cannot be used for secondary pressure limitation in this setup if increasing internal forces push the load on the consumer beyond the secondary pressure. The check valve prevents return flow via the pressure reducing valve, and thus prevents the consumer from failing if the pressure in it increases. In this case, the load line would need to be safeguarded by a pressure-limiting valve provided by the customer and made resilient.
Dimension diagrams see Chapter 4.4.2, "Intermediate plate with 3-way pressure reducing valve"
Secondary pressure setting (pressure gauge display) at flow rate Q = 0 lpm (consumer in end position). The pressure drops slightly when hydraulic oil flows to the consumer.
Version with pressure switch DG 3., monitoring of the P gallery on the supply (primary) side.
Version Z1 ... Z8 (standard version) cannot be used with a pressure switch, as the leakage oil consumption would cause the pump motor controlled by the DG.. to keep switching on an off constantly.

Intermediate plate with pressure-limiting and throttle valve

The “press control valve” (3/2-way valve with pressure-limiting and throttle valve built into the sub-plate) can be inserted in any position in the valve bank (VB 21.. or VB 31..).

Intermediate plate with 2-way flow control valve for VB 31

The proportional 2-way flow control valve in the bypass to the tank is used to deliberately vary the speed of the controlled consumers. This is achieved by diverting the portion of the (pump) delivery flow that is not required to the tank. The valve section must be placed in the first position in the valve bank (downstream of the connection block).

End plates

When combining two pressure switches, the coding /65 (1st DG 36, 2nd DG 35) is not permissible due to the risk of confusion with the coding for a pressure switch DG 365 (also /65); use /56 (1st DG 35; 2nd DG 36) here.

Heating of the solenoid

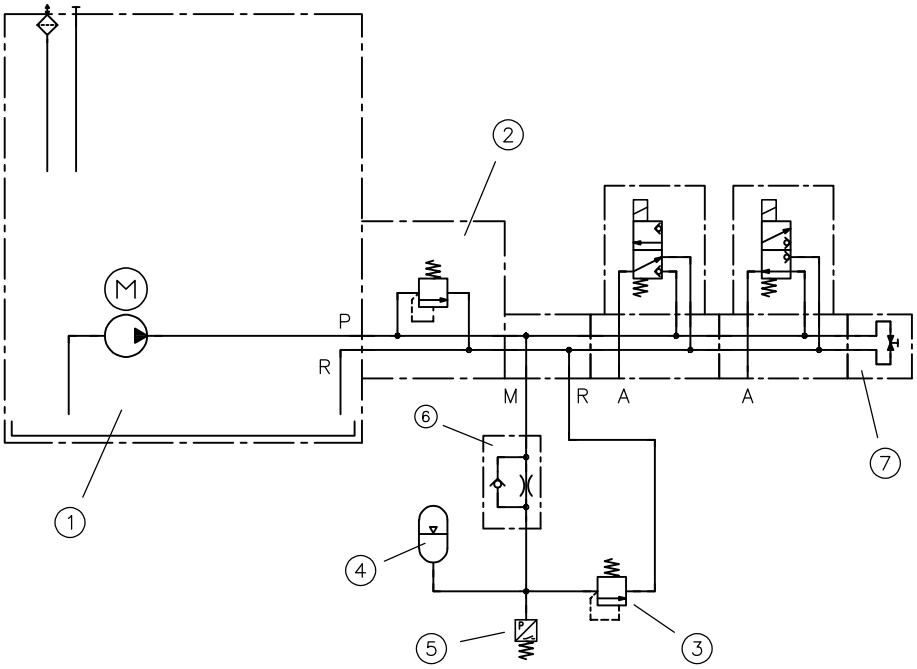
Due to the close proximity of adjacent solenoid valves in directional valve banks, heat dissipation into the valves' surroundings is limited. If actuated simultaneously and for longer duty cycles, directly adjacent valves would thermally hinder one another and heat each other up. As such, it is advisable to position at least one unactuated valve between any valves that need to be actuated simultaneously.

NOTICE
This practice must be observed in scenarios where the duty cycle of the valves is very long. If this is not possible, the option of using an economy circuit should be looked into (see D 7813, D 7832, D 7833/1).

6.3 Application example for end plate and relief valve

Example

Valve bank	VB 11 FM - HM/2 - 1 - GM 24



1 Compact hydraulic power pack e.g. MPN in accordance with D 7207
2 Operating-pressure-limiting valve set to p_3 e.g. connection block AB in accordance with D 6905 AB
3 TÜV accumulator safety valve D 7000 TUV, e.g. set to p_4 or p_3
4 Accumulator, permissible operating pressure p_4
5 Pressure switch, e.g. set to p_2, for shutting off the pump
6 Restrictor check valve with fixed throttle, e.g. RDF... in accordance with D 7450
Orifice diameter must be selected based on the Δp-Q characteristic line so that the permissible flow rate Q_{max} for the valve bank is not exceeded at the maximum possible operating pressure p_2.
7 End plate with drain valve

Pressure terms in accordance with CETOP RP62H

p_0 ... Accumulator gas filling pressure

p_1 ... Lower operating pressure of the hydraulic circuit

p_2 ... Upper operating pressure of the hydraulic circuit, e.g. also shut-off pressure for the pump motor

p_3 ... Pressure setting of the operating-pressure-limiting valve (e.g. $p_{2\ max}$)

p_4 ... Permissible operating gauge pressure of the hydraulic accumulator

NOTICE
The accumulator safety valve with unit approval is used to protect the hydraulic accumulator from impermissible excess pressure. If necessary, it is factory-set to a fixed accumulator pressure (e.g. the maximum permissible accumulator pressure p_4 or a pressure that is still permissible for the hydraulic system $p_{3\ max}$) and sealed. The limit for the largest operating pressure planned for the hydraulic system p_2 or $p_{2\ max}$ is usually adjusted using the operating-pressure-limiting valve, shut-off valve (e.g. D 7529, D 6170 ALZ) or other devices (e.g. pump shut-off or circulation using pressure switch).
