

Variable displacement axial piston pump type V30D

Product documentation

Open circuit

Nominal pressure $p_{\text{nom max}}$:

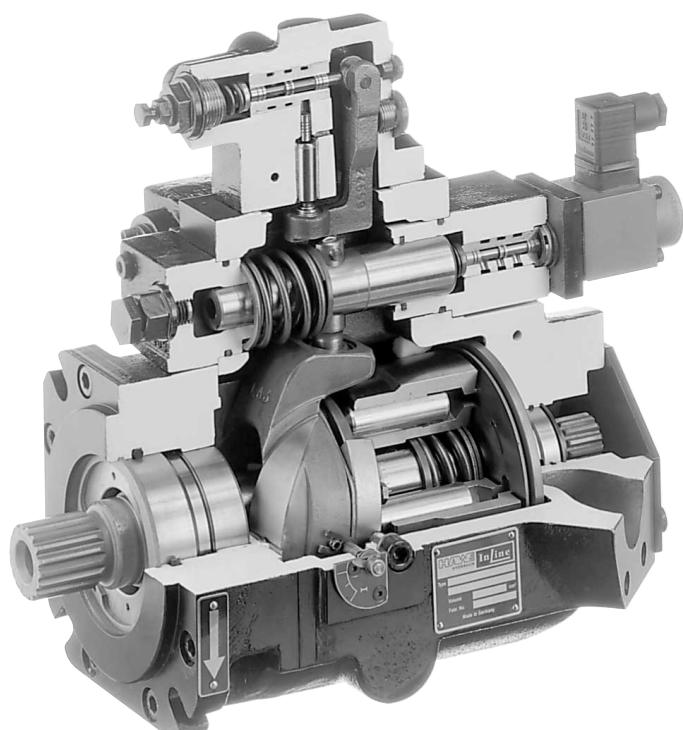

350 bar

Peak pressure p_{max} :

420 bar

Geometric displacement V_{max} :

250 cm³/U

1 Overview: variable displacement axial piston pump type V30D

Variable displacement axial piston pumps adjust the geometric output volume from maximum to zero. As a result they vary the flow rate that is provided to the consumers.

The axial piston pump type V30D is designed for open circuits in industrial hydraulics and operate according to the swash plate principle. They are available with the option of a thru-shaft for operating additional hydraulic pumps in series.

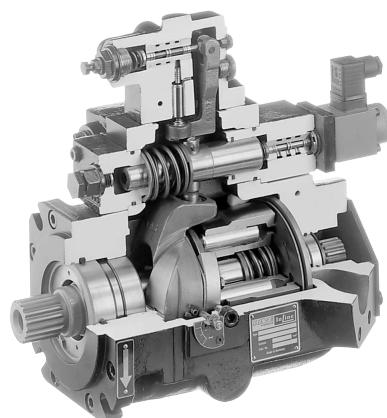

The sturdy pump is particularly suitable for continuous operation in challenging applications. The range of pump controllers allows the axial piston pump to be used in a wide variety of applications.

Features and benefits:

- Low-noise emissions
- Long lifetime even under demanding application conditions
- Broad selection of controllers
- Full torque available at the second pump in tandem pump applications

Intended applications:

- Hydraulic presses
- Marine applications
- Industrial plants
- Power pack assembly
- Mining and tunnel boring machines

4.2 Controller type LSD

4.3 Controller type PD5

4.4 Cover for version without L, Lf1, LSD, PD5

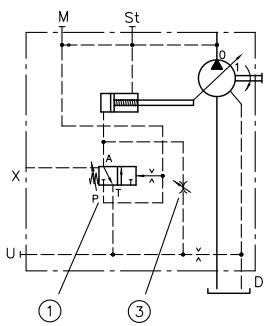

2.2.1 Controller LS, LSN, LSP, LSD

The LS(N,P,D) controller is a delivery flow controller that generates a variable flow rate independently of the speed. It adapts the geometric displacement of the pump to the required flow rate of the consumer and regulates a constant difference between load pressure and pump pressure.

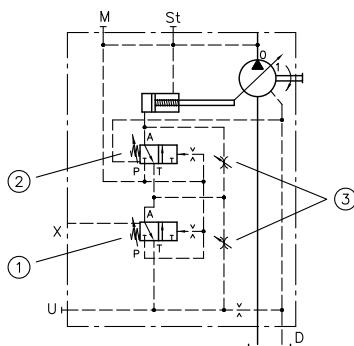

- **LS:** Without pressure limitation
- **LSN:** With integrated pressure limitation
- **LSP:** With remote-control port for external pressure limitation
- **LSD:** Without pressure limitation for parallel operation of several pumps

The LSD controller is used if several pumps supply the same consumer. It regulates the same geometric displacement on all pumps.

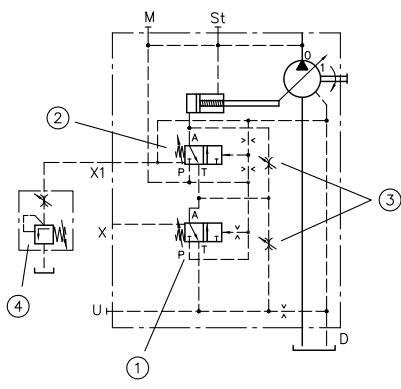

Coding LS

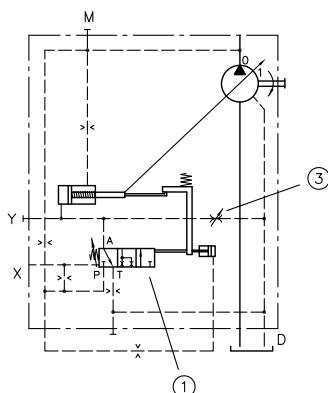

Coding LSN

Coding LSP

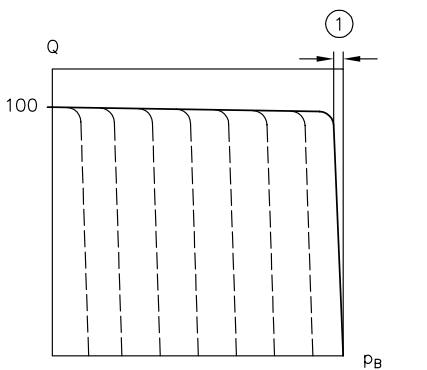

Coding LSD

- 1 Delivery flow controller: Regulates a constant difference between load pressure and pump pressure
- 2 Pressure limitation: Limits the pump pressure to a maximum value
- 3 Bypass throttle
- 4 External pressure-limiting valve (not included in scope of delivery)

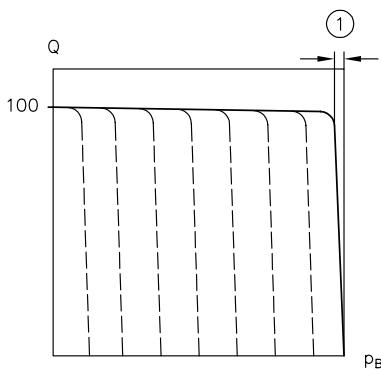

Characteristic curve LS, LSN, LSP

p_B operating pressure (bar); Q delivery flow (%)

1 Approx. 3 bar

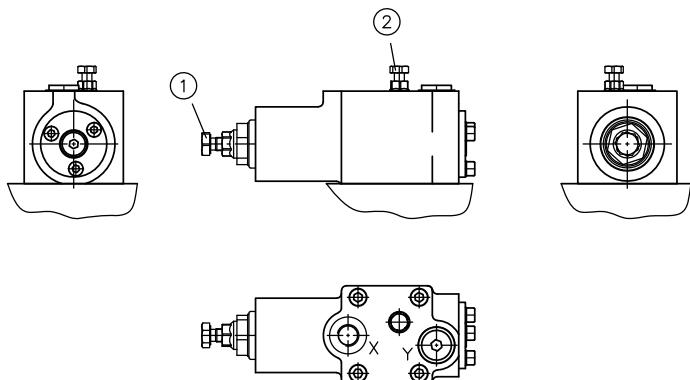

Coding LSD

p_B operating pressure (bar); Q delivery flow (%)

1 Approx. 12 bar

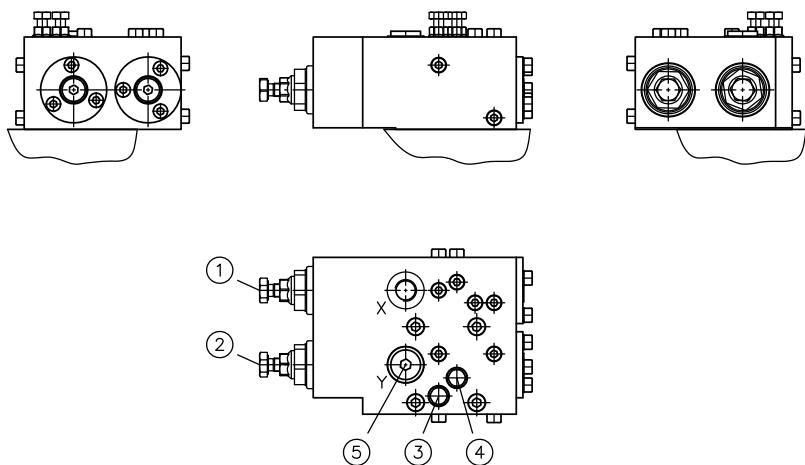

Coding LS

1 Differential pressure Δp (stand-by pressure)

2 Bypass throttle

Coding LSN, LSP

1 Differential pressure Δp (stand-by pressure)

2 Maximum pressure p_{max} (pressure limitation)

3 Bypass throttle LS

4 Bypass throttle N

5 For coding LSN with tapped plug closed

Pressure adjustment

Pressure adjustment	Pressure range (bar)	Δp (bar)/revolution	Factory-set pressure setting (bar)
Maximum pressure p_{\max} (N250) ¹⁾	50 ... 200	Approx. 50	200
Maximum pressure p_{\max} (N400) ¹⁾	100 ... 350	Approx. 100	300
Differential pressure Δp (P)		Approx. 15	15
Differential pressure Δp (LS)		Approx. 15	30

1) Depending on the pressure setting, either a weak spring (N250) or a strong spring (N400) is installed.

CAUTION

Risk of injury on overloading components due to incorrect pressure settings!

Risk of minor injury.

- Always monitor the pressure gauge when setting and changing the pressure.

NOTE

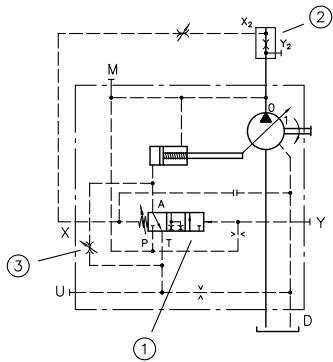

Loosen the lock nut sufficiently before setting so that the sealing ring is not damaged.

2.2.2 Controller Q, Qb

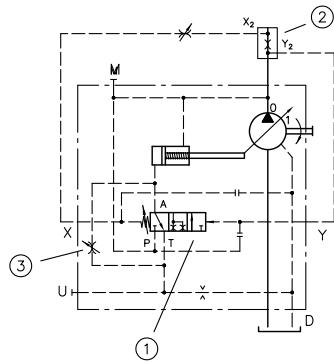

The Q(b) controller is a delivery flow controller that generates a constant flow rate independently of the speed. It regulates a constant differential pressure via an orifice in the P gallery. The differential pressure can be set between 15 and tbd bar; the orifice is available in different graduations (see table).

- **Q:** Standard version
- **Qb:** Version with external feedback of the pump pressure to compensate for a pressure loss in the P line. For use in hydrostatic applications with high demands on the speed consistency, e.g. generator drives.

Coding **Q**

Coding **Qb**

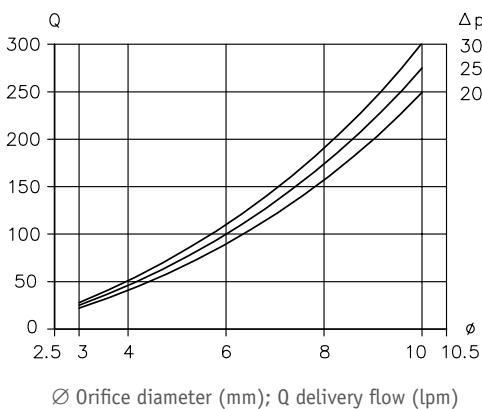

1 Delivery flow controller: Regulates a constant differential pressure before and after the orifice

2 Orifice: Selection based on the table (not included in the scope of supply)

3 Bypass throttle

Orifice (mm)	Flow rate at 20 bar differential pressure (lpm)	Orifice (mm)	Flow rate at 20 bar differential pressure (lpm)
3	Approx. 23	7	Approx. 127
3.5	Approx. 32	7.5	Approx. 146
4	Approx. 42	8	Approx. 166
4.5	Approx. 53	8.5	Approx. 188
5	Approx. 65	9	Approx. 210
5.5	Approx. 79	9.5	Approx. 234
6	Approx. 94	10	Approx. 260
6.5	Approx. 110		

Coding Q, Qb

Determination of the flow rate

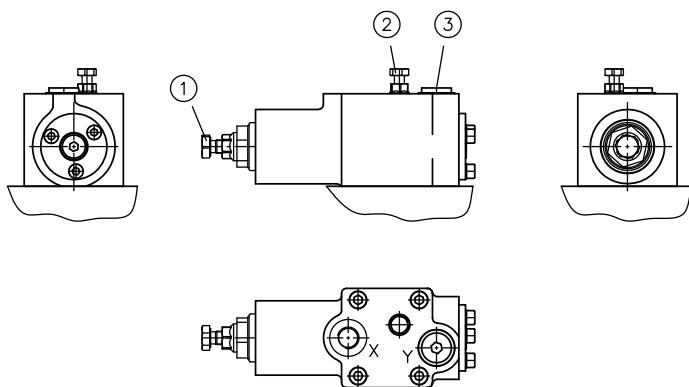

$$Q = 0,55 \cdot d^2 \sqrt{\Delta p}$$

Q = Flow rate (lpm)

d = Orifice diameter (mm)

Δp = Pressure difference (bar)

Coding Q, Qb

1 Differential pressure Δp (stand-by pressure)

2 Bypass throttle

3 Y-port. For coding Q with tapped plug closed With coding Qb pressure signal port before the orifice.

Pressure adjustment

Pressure adjustment	Pressure range (bar)	Δp (bar)/revolution	Factory-set pressure setting (bar)
Differential pressure Δp		Approx. 15	15

NOTE

Loosen the lock nut sufficiently before setting so that the sealing ring is not damaged.

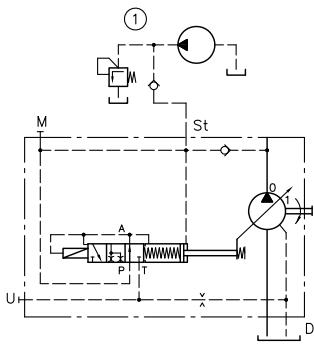

2.2.3 Controller V, VH

The V and VH controllers are proportional flow controllers that generate a variable, speed-dependent flow rate. They adjust the geometric displacement of the pump based on an electrical or hydraulic input signal. The resulting flow rate depends on the geometric displacement and the rotation speed.

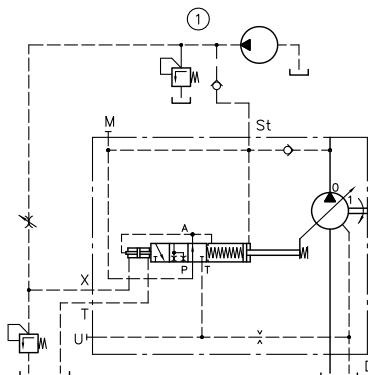

The required pilot pressure for adjusting the pivoting angle is tapped internally. When used in open centre systems with operating pressures of < 25 bar, an external auxiliary pump or a pre-load valve must be provided to ensure reliable adjustment.

- **V:** Electric flow controller with increasing characteristic curve.
- **VH:** Hydraulic delivery flow controller with increasing characteristic curve.

Coding V

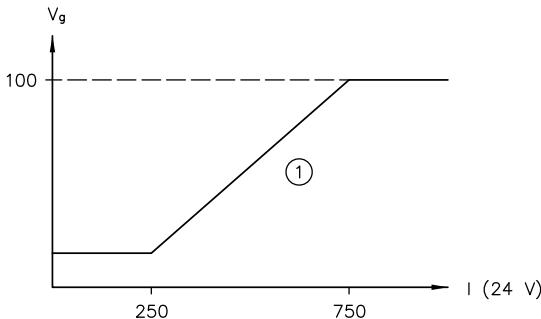

Coding VH

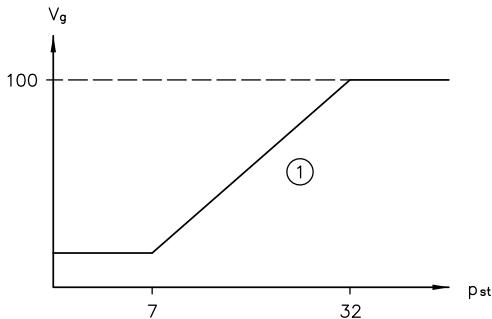

1 External auxiliary pump, pressure-limiting valve and check valve (not included in scope of delivery)

Coding V

1 Hysteresis approx. 2 %

Coding VH

1 Hysteresis approx. 4 %

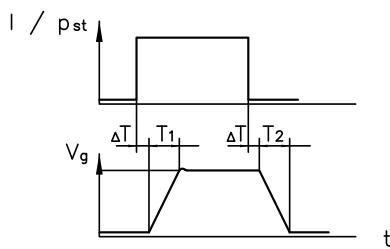

i NOTE

$Q = 0 \text{ lpm}$ possible through the use of an auxiliary pump.

At $V_g = 0 \text{ cm}^3/\text{rev}$, additional rinsing via the drain port is required to ensure sufficient lubrication of the pump.

Recommended flow rate: 2 lpm (V30D-045/075), 3 lpm (V30D-095/115), 4 lpm (V30D-140/160) or 5 lpm (V30D-250)

Response time

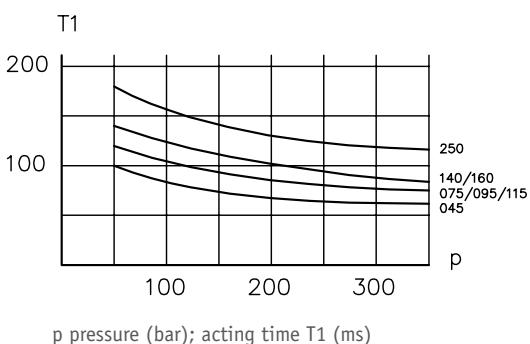

ΔT = Delay

T_1 = On-stroke time 0 to max.

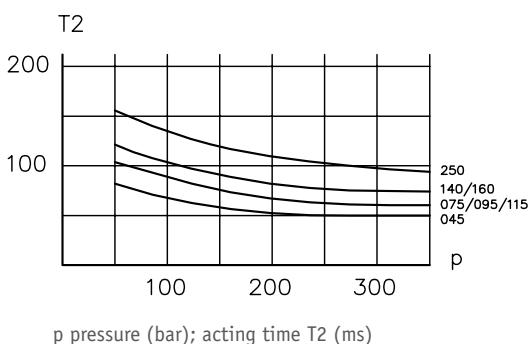

T_2 = On-stroke time max. to 0

Acting time T_1 (ms)

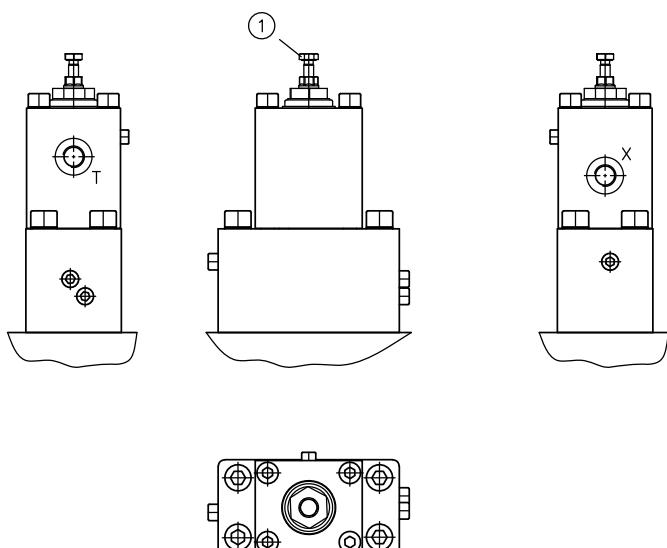

p pressure (bar); acting time T_1 (ms)

Acting time T_2 (ms)

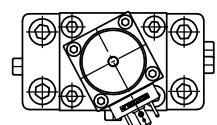

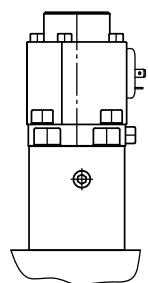

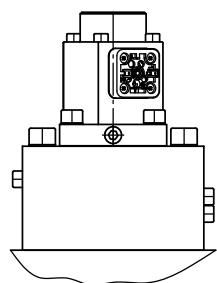

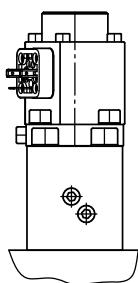

p pressure (bar); acting time T_2 (ms)

Coding VH

1 Stroke limitation control valve

Coding V

2.2.4 Controller N, P, Pb and PD5

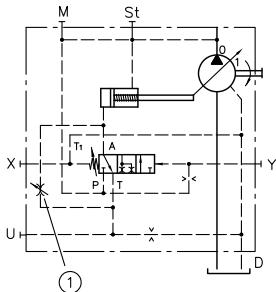

The N, P, Pb and PD5 controllers are pressure controllers. As soon as the pump pressure exceeds the set value, they reduce the pivoting angle of the pump and regulate a constant pressure level.

Depending on the controller type, the pressure setting takes place either via a setting screw directly on the controller or via an external pilot valve.

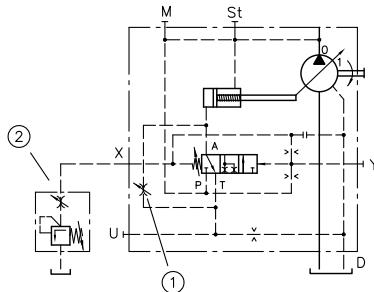

- **N:** The pressure setting takes place via a setting screw directly on the controller.
- **P:** The pressure setting takes place via an external pilot valve connected to the controller via a control port.
- **Pb:** The pressure setting takes place via an external pilot valve connected to the controller via a control port. The pressure in the P line is recorded outside the pump.
It is really only useful for extremely vibration-prone systems (e.g. accumulator systems).
- **PD5:** Parallel pressure controller. The PD5 controller is used if several pumps supply the same consumer. It regulates the same geometric displacement on all pumps. The pressure setting takes place via an external pilot valve connected to the controllers via a control ports.

The pressure controllers can either be used in constant pressure systems or as low-loss pressure limitation in combination with a flow controller (e.g. type V or VH).

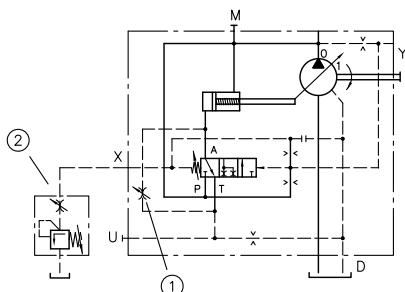

Coding N

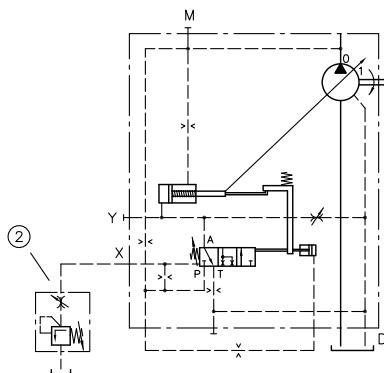

Coding P

Coding Pb

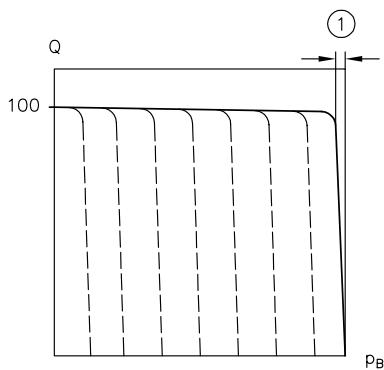

Coding PD5

1 Bypass throttle

2 External pressure-limiting valve (not included in scope of delivery)

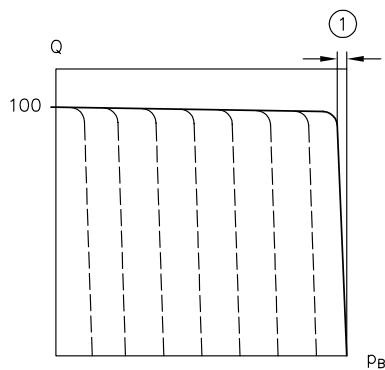

Characteristic curve N, P, Pb

p_B operating pressure (bar); Q delivery flow (%)

1 Approx. 3 bar

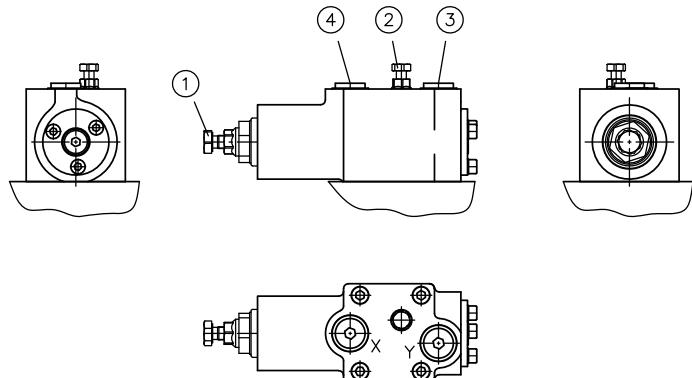

Characteristic curve PD5

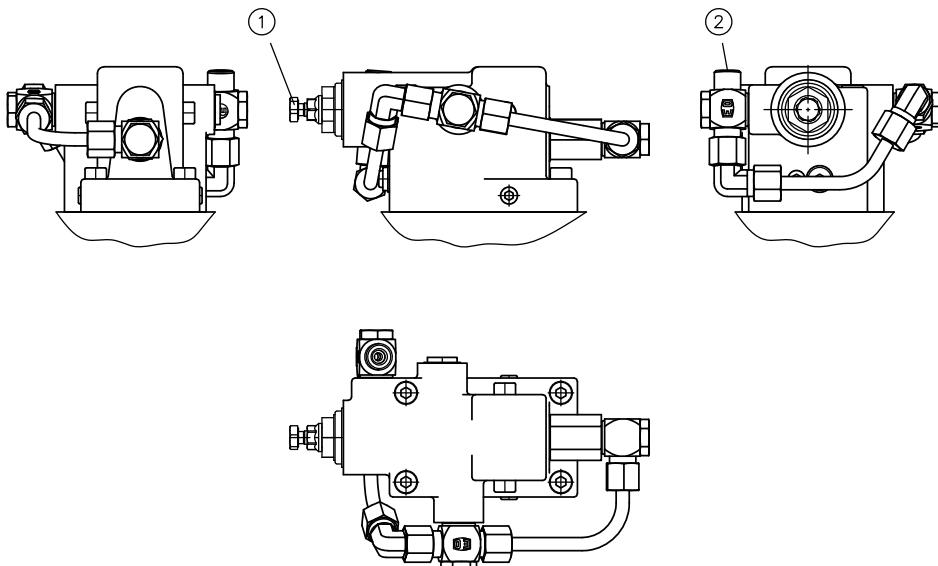

p_B operating pressure (bar); Q delivery flow (%)

1 Approx. 12 bar

Coding N, P, Pb

- 1 Pressure setting p
- 2 Bypass throttle
- 3 Y-port: For coding N and P with tapped plug closed
- 4 X port: For coding N with tapped plug closed

Coding PD5

1 Pressure setting p

2 X port

Pressure adjustment

	Pressure range (bar)	Δp (bar)/revolution	Factory-set pressure setting (bar)
N 250 ¹⁾	50 to 200	Approx. 50	200
N 400 ¹⁾	100 to 350	Approx. 100	300
P, Pb, PD5		Approx. 15	15

1) Depending on the pressure setting, either a weak spring (N250) or a strong spring (N400) is installed.

⚠ CAUTION

Risk of injury on overloading components due to incorrect pressure settings!

Risk of minor injury.

- Always monitor the pressure gauge when setting and changing the pressure.

ℹ NOTE

Loosen the lock nut sufficiently before setting so that the sealing ring is not damaged.

2.2.5 Controller L, Lf and Lf1

The L, Lf and Lf1 controllers are power controllers. As soon as the product of geometric displacement and pressure exceeds the set value, the controller reduces the pivoting angle of the pump to protect the drive shaft, motor or gearbox from overload ($p_B \times V_g = \text{constant}$).

The setting is made either as a torque limitation (Nm) or power limitation (kW) at the corresponding rotation speed (rpm).

Drive torque

$$M = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}} (\text{Nm})$$

M = Torque (Nm)

V_g = Geometric output volume (cm^3/rev)

Drive power

$$P = \frac{2\pi \cdot M \cdot n}{60000} = \frac{Q \cdot \Delta p}{600 \cdot \eta_t} (\text{kW})$$

Δp = Differential pressure

p_B = Operating pressure

P = Power (kW)

Q = Flow rate (lpm)

n = Rotation speed (rpm)

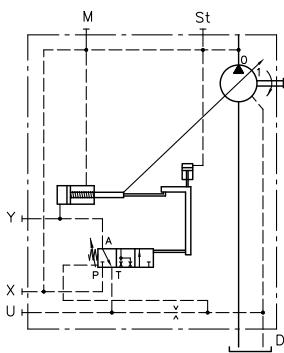

η_v = Volumetric efficiency

η_{mh} = Mechanical-hydraulic efficiency

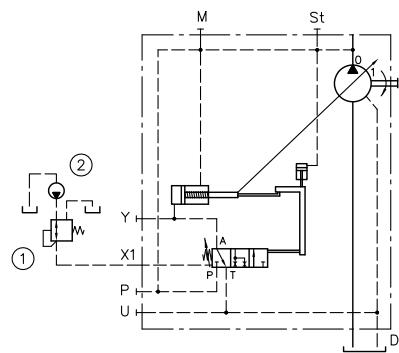

η_T = Overall efficiency $\eta_T = \eta_v \cdot \eta_{mh}$

- **L:** Power controller with fixed setting value
- **Lf:** Hydraulically adjustable power controller with increasing characteristic curve
- **Lf1:** Hydraulically adjustable power controller with decreasing characteristic curve

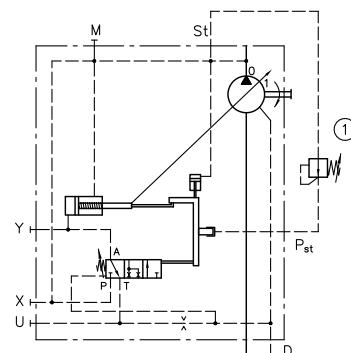

Coding L

Coding Lf

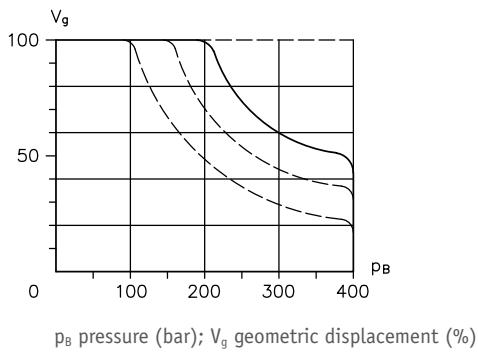

Coding Lf1

1 External pressure reducing valve (not included in scope of delivery)

2 External auxiliary pump (not included in scope of delivery)

Coding L, Lf, Lf1

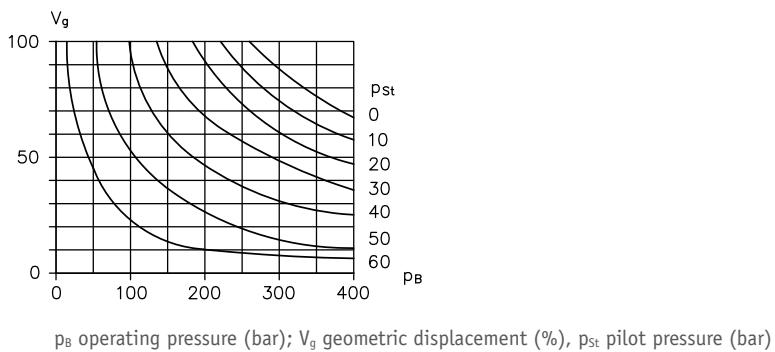

Smallest recommended nominal torque setting (only valid for versions without additional controllers)

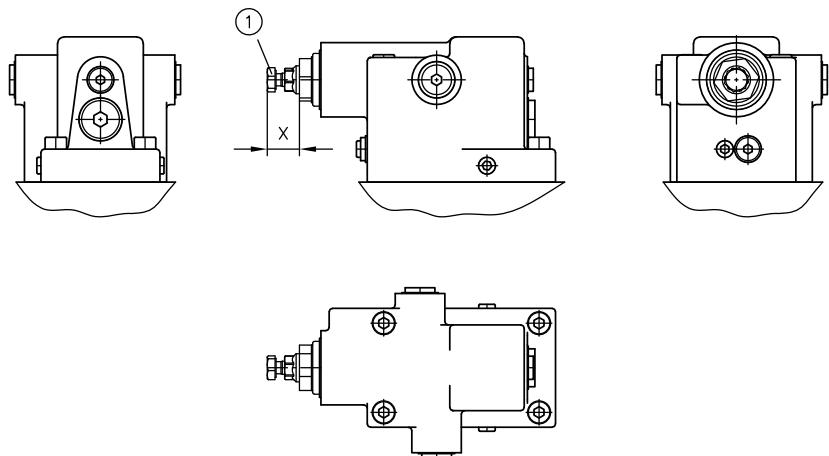

Coding	Nm	Corresponds to kW/rpm
045	40	6/1500
075	70	11/1500
095/115	99	15/1500
140/160	146	22/1500
250	271	41/1500

Coding Lf1

rough reference values for the remote setting of the Lf1 controller

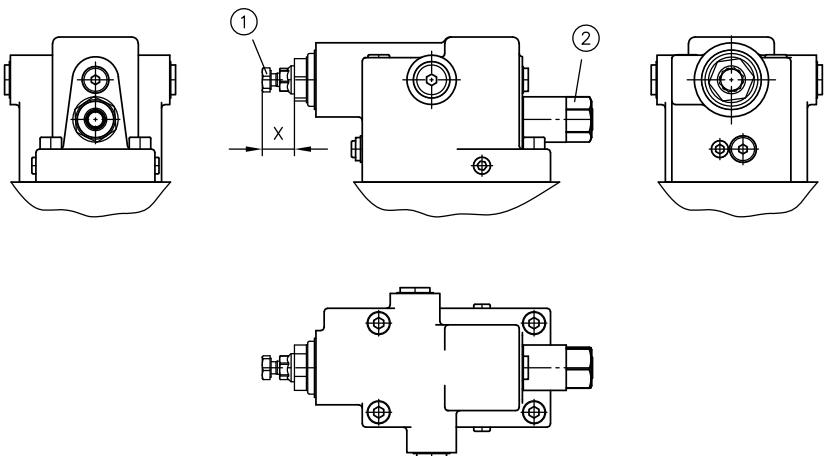

Coding L

1 Torque setting

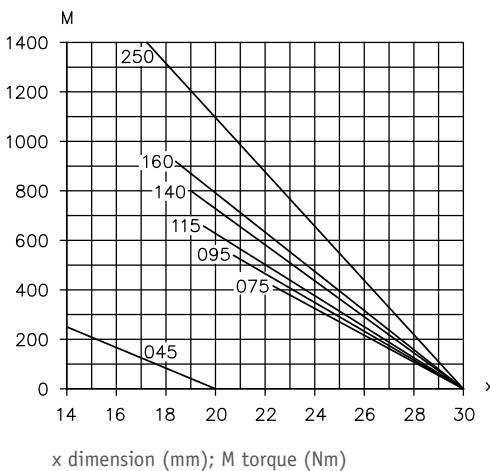

Coding **Lf, Lf1**

1 Differential pressure Δp (stand-by pressure)

2 p_{St} port

Coding **L, Lf, Lf1**

i NOTE

Loosen the lock nut sufficiently before setting so that the sealing ring is not damaged.

3 Parameters

3.1 General

Designation	Variable displacement axial piston pump
Design	Axial piston pump according to the swash plate principle
Mounting	Mounting flange according to DIN ISO 3019-1 or DIN ISO 3019-2
User interface	Primed
Drive/output torque	See " Max. permissible drive/output torque "
Installation position	Any (for installation information see 5 "Assembly, operation and maintenance recommendations")
Rotation direction	Right, left or on both sides
Connections	<ul style="list-style-type: none"> ▪ Suction port ▪ Pressure connection ▪ Drain port ▪ Pressure gauge connection

5 Assembly, operation and maintenance recommendations

5.1 Intended use

This product is intended exclusively for hydraulic applications (fluid technology).

The user must observe the safety measures and warnings in this documentation.

Essential requirements for the product to function correctly and safely:

- All information in this documentation must be observed. This applies in particular to all safety measures and warnings.
- The product must only be assembled and put into operation by qualified personnel.
- The product must only be operated within the specified technical parameters. The technical parameters are described in detail in this documentation.
- The operating and maintenance manual of the components, assemblies and the specific complete system must also always be observed.

If the product can no longer be operated safely:

1. Remove the product from operation and mark it accordingly.
- ✓ It is then not permitted to continue using or operating the product.

5.2 Assembly information

The product must only be installed in the complete system with standard and compliant connection components (screw fittings, hoses, pipes, fixtures etc.).

The product must be shut down correctly prior to dismounting (in particular in combination with hydraulic accumulators).

DANGER

Risk to life caused by sudden movement of the hydraulic drives when dismantled incorrectly!

Risk of serious injury or death.

- Depressurise the hydraulic system.
- Perform safety measures in preparation for maintenance.

5.2.1 General information

The V30D variable displacement axial piston pump is designed for use in an open circuit. It can be mounted using a mounting flange in accordance with ISO 3019-1 or DIN ISO 3019-2.

During assembly, note the following principles:

Only trained persons are allowed to mount or remove the pump. Always ensure absolute cleanliness to prevent contamination from affecting the pump.

- Remove all plastic plugs before operation.
- Avoid installation above the tank (see installation positions in [Chapter 5.2.3, "Installation positions"](#)).
- For electric reference values Suction intakes must be adhered to.
- Before initial use, fill the pump with hydraulic fluid and bleed. Automatic pump filling via the suction line by opening the drain ports is not possible.
- Never drain the pump.
- Always supply the pump with hydraulic fluid from the start. Even just a short period with insufficient hydraulic fluid can damage the pump. Such damage is not immediately visible once the pump is put into operation.
- Hydraulic fluid which flows back into the tank must not be sucked back in immediately (install baffles!).
- Before first use, run the pump for approx. 10 minutes at max. 50 bar after initial start-up.
- Do not use the entire pressure range of the pump until it has been thoroughly bled and flushed.
- From the start, always keep the temperature within the specified range (see [Chapter 3, "Parameters"](#)). Never exceed the maximum temperature.
- Always comply with the cleanliness level of the hydraulic fluid. In addition, always filter the hydraulic fluid appropriately (see [Chapter 3, "Parameters"](#)).
- Self-installed filters in the suction line must be approved beforehand by HAWE Hydraulik.
- A system pressure-limiting valve must be installed in the pressure line so that the maximum system pressure is not exceeded.

5.2.2 Connections

The nominal width of the connecting lines depends on the specified operating conditions, the viscosity of the hydraulic fluid, the start-up and operating temperatures and the rotation speed of the pump. In principle we recommend the use of hose lines due to the superior damping characteristics.

Bleeding and flushing port

V30D pumps are fitted with two G1/4 (BSPP) bleeding and flushing ports. These are used to bleed and flush the front shaft bearing in the case of vertical installation.

Pressure connection

The pressure connection takes place via SAE ports, see [Chapter 4, "Dimensions"](#). Metric attachment threads are used in deviation from the standard.

Observe the tightening torque specified by the fitting manufacturer.

Suction port

The suction port can be established via SAE ports for the pump; see [Chapter 4, "Dimensions"](#). Metric attachment threads are used in deviation from the standard.

If possible, route the suction line to the tank on a rising gradient. This allows trapped air to escape. Observe the specifications in Installation positions [Chapter 5.2.3, "Installation positions"](#). The absolute suction pressure must not fall below 0.85 bar. A hose line should generally be used in preference to a rigid pipe.

Drain port

The V30D pumps have 2 drain ports G 1/2 (BSPP), G 3/4 (BSPP) or M33.

The nominal width of the leakage line must not be less than 16 mm. The cross-section is determined by the max. permissible housing pressure.

Integrate the leakage line in the system in such a way as to prevent direct connection with the suction line of the pump.

All drain ports can be used simultaneously.

A separate leakage line from the controller to the tank is not required. Observe the specifications in [Chapter 5.2.3, "Installation positions"](#).

The top drain port can be used to fill the housing.

LS port with version LS, LSN, LSP, Q and Qb

The LS line is connected to the controller via a G 1/4 (BSPP) threaded connection.

The nominal width of the line depends on the installation position of the pump and should be 10% of the pressure line capacity. A hose line should generally be used in preference to a rigid pipe connection.

- When the proportional directional spool valve is in a neutral position, the LS line must be fully relieved.

For operation with HFC (35 - 50 % water content) the following restrictions apply

- The tank is above the pump
- The temperature does not exceed 50°C
- The fluid velocity in the suction line is below 1 m/s
- Pump pressure maximum 200 bar
- The two shaft bearings of the pump are each flushed with a separate supply of cool oil, per bearing with 2 lpm (V30D-045/075), 3 lpm (V30D-095/115), 4 lpm (V30D-140/160) and 5 lpm (V30D-250)

For operation with liquids with a water content ≤ 20 % the following restrictions apply

- The tank is above the pump
- The tank temperature does not exceed 70°C
- The fluid velocity in the suction line is below 1 m/s
- Pump pressure maximum 300 bar
- Possible without bearing flushing

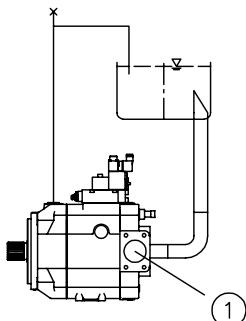

5.2.3 Installation positions

The V30D variable displacement axial piston pump can be mounted in any installation position.

A support is required for tandem pumps or multiple hydraulic pumps mounted in series (see [Chapter 5.2.1, "General information"](#)). The following points must be observed:

Horizontal installation: (pump below the min. fill level)

⇒ For horizontal installation, use the uppermost drain port

Vertical installation: (pump below the min. fill level)

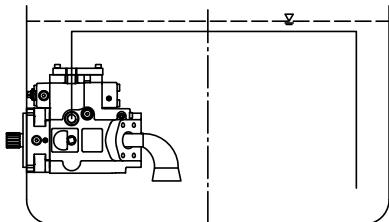

- ⇒ Assemble the pump so that the pump mounting flange is facing upwards.
- ⇒ For vertical installation, use the uppermost drain port.
- ⇒ Also connect the G 1/8" (BSPP) bleeding port on the pump flange (see [Chapter 4, "Dimensions"](#)).
- ⇒ Take appropriate measures to ensure continuous bleeding of this line (line routing/bleeding).

For installation with the pump flange facing downwards, please contact HAWE Hydraulik.

5.2.4 Tank installation

Tank installation (pump below the min. fill level)

The pump can be operated either with or without a suction intake. It is recommended to use a short suction intake (see [D 7960 N](#), 6.1.1 Suction intakes).

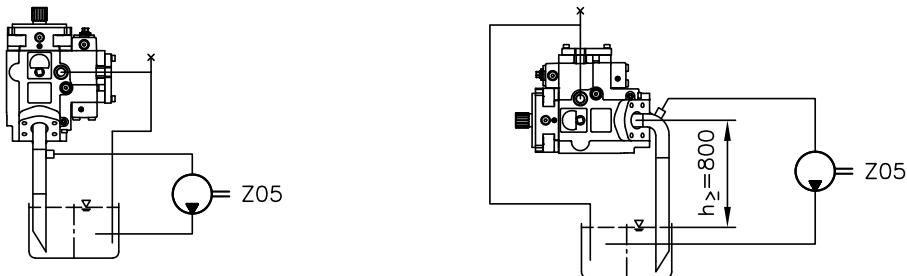

Additional notes regarding installation above the fill level

Special measures are required if the pump is installed above the fill level. The pump must not run dry via the pressure, intake, drain, bleed or control lines. This applies in particular to long periods of downtime.

- The leakage line must be installed in the tank in such a way that it ends below the oil level.
- Facilitate bleeding of connecting lines via separate bleed openings.
- Adjust the bleeding sequence to the specific installation.
- If necessary, a gear pump should be provided in order to draw air from the suction line.

For specialist advice on designing axial piston pumps, the following contact form is available:
[Checklist for designing variable displacement axial piston pumps: B 7960 checklist](#).

For further information on installation, operation and maintenance, see the relevant assembly instructions:
[B 7960](#), [B 5488](#).

5.3 Operating instructions

Restrictions in operation during cold start phase and warm-up phase

Phase	Temperature	Viscosity (mm ² /s)
Cold start phase	-25 -40 °C	< 1000
Warm-up phase	-25 80 °C	500 ... 1000
Normal operation	-25 80 °C	10 ... 500

i NOTE

Optimum range: 16 - 35 mm²/s

Cold start phase:

- $p_B = 20 - 30$ bar
- $n \leq 1000$ rpm

Warm-up phase:

- $p_B = 20 - 200$ bar
- $n \leq 1500$ rpm

Normal operation:

No further restrictions. Service conditions according to Chapter 3 Parameters.

Note product configuration and pressure / flow rate

The statements and technical parameters in this documentation must be strictly observed.

The instructions for the complete technical system must also always be followed.

i NOTE

- Read the documentation carefully before usage.
- The documentation must be accessible to the operating and maintenance staff at all times.
- Keep documentation up to date after every addition or update.

⚠ CAUTION

Risk of injury on overloading components due to incorrect pressure settings!

Risk of minor injury.

- Always monitor the pressure gauge when setting and changing the pressure.

Purity and filtering of the hydraulic fluid

Fine contamination can significantly impair the function of the hydraulic component. Contamination can cause irreparable damage.

Examples of fine contamination include:

- Metal chips
- Rubber particles from hoses and seals
- Dirt due to assembly and maintenance
- Mechanical debris
- Chemical ageing of the hydraulic fluid

i NOTE

Fresh hydraulic fluid from the drum does not always have the necessary degree of purity.

When pouring in hydraulic fluid, filter it.

Adhere to the cleanliness level of the hydraulic fluid in order to maintain faultless operation.
(also see cleanliness level in [Chapter 3, "Parameters"](#))

- Fixed displacement axial piston pump type K60N: D 7960 K
- Fixed displacement axial piston pump type K61N: D 7961 K
- Axial piston motors type M60N: D 7960 M
- Proportional directional spool valve, type PSL and PSV size 2: D 7700-2
- Proportional directional spool valve, type PSL, PSM and PSV size 3: D 7700-3
- Proportional directional spool valve, type PSL, PSM and PSV size 5: D 7700-5
- Proportional directional spool valve type PSLF, PSVF and SLF size 3: D 7700-3F
- Proportional directional spool valve type PSLF, PSVF and SLF size 5: D 7700-5F
- Proportional directional spool valve banks type PSLF and PSVF size 7: D 7700-7F
- Load-holding valve type LHT: D 7918
- Load-holding valve type LHDV: D 7770
- Proportional amplifier type EV1M3: D 7831/2
- Proportional amplifier type EV1D: D 7831 D
