Hydraulic power pack type KA - "for demanding"

More powerful by an extended product range

HAWE Hydraulik, Munich, has enlarged the product range of the hydraulic power pack type KA. Thus opening additional, demanding fields of application for users.

The basic version of this ready to use product consists of a pump, a tank and the fluid immersed motor inside. The power pack can supply up to 700 bar (radial piston pump) or up to 200 bar (gear pump) for short-time or intermittent operation. Versions featuring two pumps will supply hydraulic consumers with differing pressure levels. The power pack can be positioned horizontally or vertically and has low spatial requirement due to its compact design.

There are three tank extensions available which allow the tank size to be customized depending on the fluid demand of the application. Thus enabling tank volume from two to ten liters.

The latest option is an auxiliary blower, significantly reducing the operation (fluid) temperature. The auxiliary blower assists the already good thermal characteristic and lets us spread the permissible operation time even further. This option is available for both vertical and horizontal versions.

For all those where these power packs are operated under damp ambient conditions there is an optional silicagelfilter (only with vertical versions) preventing condensation of water from breathed in air.

These power packs type KA do have now an even further spread range of application. It spreads from industrial applications like machine tools etc. to mobile applications to elevated work platforms etc.
